## Unit 4

Types of Chemical Reactions

## OOIPOtiveS

- Define the observations that indicate a chemical reaction has occurred.
- Classify chemical reactions according to the 5 main categories.
- Discuss the properties of water that make it the most common solvent.
- Identify whether a substance is a strong, weak, or non electrolyte.
- Calculate the concentration of solutes in units of molarity, molality, mass percent and parts per million.
- Perform stoichiometric calculations using solution concentration.
- Recognize the common types of reactions in aqueous solution.
- Write chemical equations for the common types of reactions in aqueous solution.
- Determine the oxidation number of atoms in compounds.
- Balance oxidation-reduction reactions.
- Determine the reducing agent, oxidizing agent, which reactant is being oxidized and which reactant is being reduced in a chemical reaction.
- Predict products of a chemical reaction using solubility rules.
- Write the net ionic equation for a chemical equation.
- Identify a Bronsted-Lowry acid and base.
- Determine the conjugate acid-base pair in a neutralization reaction.

## Chemical Reactions

- Process where the starting material (reactants) are chemical composition is changed (to products).

## Signs of a Chemical Reaction

- Color Change
- Gas Evolving (bubbling)
- Precipitation
- Heat Change
- pH Change

## Types of Chemical Reactions

- 5 main classifications
- Synthesis
- Decomposition
- Combustion
- Single Replacement
- Double Replacement

## Synthesis

- A reaction where two reactants combine to form 1 product.

$$
A+B \rightarrow C
$$

## Decomposition

- A reaction where a single reactant separates to form two or more products.

$$
A \rightarrow B+C
$$

$$
2 \mathrm{KClO}_{3} \rightarrow 2 \mathrm{KCl}+3 \mathrm{O}_{2}
$$

$$
\mathrm{CaCO}_{3} \rightarrow \mathrm{CaO}+\mathrm{CO}_{2}
$$

## Combustion

- A reaction where a reactant burns in the presence of oxygen to form carbon dioxide and water.

$$
\begin{gather*}
\mathrm{X}+\ldots \mathrm{O}_{2(\mathrm{~g})} \rightarrow-\mathrm{CO}_{2(\mathrm{~g})}+\ldots \mathrm{H}_{2} \mathrm{O} \\
\mathrm{C}_{3} \mathrm{H}_{8(\mathrm{~g})}+5 \mathrm{O}_{2(\mathrm{~g})} \rightarrow 3 \mathrm{CO}_{2(\mathrm{~g})}+4 \mathrm{H}_{2} \mathrm{O} \tag{g}
\end{gather*}
$$

## Single Replacement

- A reaction where an element and a compound react. The element replaces a similar element in the compound.

$$
A+B C \rightarrow A C+B
$$

$\mathrm{Cu}_{(\mathrm{s})}+2 \mathrm{AgNO}_{3(\mathrm{aq})} \rightarrow \mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2(\mathrm{aq})}+2 \mathrm{Ag}$
$\mathrm{Mg}_{(\mathrm{s})}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \rightarrow \mathrm{Mg}(\mathrm{OH})_{2(\mathrm{aq})}+\mathrm{H}_{2(\mathrm{~g})}$

## Double Replacement

- A reaction where the elements from two compounds replace one another. (Partners switch).

$$
\mathrm{AB}+\mathrm{CD} \rightarrow \mathrm{AD}+\mathrm{CB}
$$

$$
\begin{gather*}
\mathrm{AgNO}_{3(\mathrm{aq)}}+\mathrm{NaCl}_{(\mathrm{aq)}} \rightarrow \mathrm{AgCl}_{(\mathrm{s})}+\mathrm{NaNO}_{3(\mathrm{aq})} \\
\mathrm{HCl}_{(\mathrm{aq)}}+\mathrm{NaOH}_{(\mathrm{aq)}} \rightarrow \mathrm{NaCl}_{(\mathrm{aq)}}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \tag{1}
\end{gather*}
$$

## Aqueous Solutions

- Water covers about $\sim 70$ percent of the earth's surface.
- Many reactions occur in water.

## Water as a Solvent

- Water is a polar molecule (has a dipole).
- Dissolves polar and ionic compounds.
- Polar molecules that do not break apart in aqueous solutions: nonelectrolytes.
- Ionic molecules that do break apart into individual ions in solution: electrolytes.

## Electrolyte Solutions

- Conduct electricity.
- Have ions in solution.
$\mathrm{NaCl}_{(\mathrm{s})} \rightarrow \mathrm{Na}^{+}{ }_{(\mathrm{aq})}+\mathrm{Cl}^{-}{ }_{(\mathrm{aq})}$
$\mathrm{MgCl}_{2(\mathrm{~s})} \rightarrow \mathrm{Mg}^{2+}{ }_{(\mathrm{aq})}+2 \mathrm{Cl}^{-}{ }_{(\mathrm{aq})}$

## Electrolyte Solutions

- Strong Electrolytes:
- Break apart COMPLETELY in solutions.
- Are always soluble.
- Make solutions that conduct electricity very well.
- Weak Electrolytes:
- A small percentage of molecules break into ions in solution.
- Are slightly soluble.
- Make solutions that conduct electricity a little.
- Nonelectrolytes:
- Covalent molecules and nonsoluble ionic compounds that are not soluble.
- Make solutions that do not conduct electricity.
*Rely on solubility rules to determine whether a compound is an electrolyte or not.
Angie Sadaf. Electrolytes - Testing for Electrolytic Behavior. 2011. Standard YouTube License.

## Stoichiometry in Aqueous

## Reactions

- Solutions
- Homogeneous mixtures.
- Solute - dissolved substance.
- Solvent - substance dissolving the solute.
- Concentration - given in terms of the amount of solute dissolved.

## Solution Concentration

- Molarity
- Mol solute dissolved per liter solution.

$$
\mathrm{M}=\frac{\text { Mol solute }}{\mathrm{L} \text { Solvent }}
$$

## Solution Concentration

- Molality
- Mol solute dissolved per kg solvent.

$$
\mathrm{m}=\frac{\text { Mol solute }}{\mathrm{kg} \text { solvent }}
$$

## Solution Concentration

- Mol Fraction (X)
- Mol solute dissolved divided by total mol (mol solute + mol solvent).

Mol Solute
Total mol
$=\quad$ Mol Solute
Mol Solute + Mol Solvent

## Solution Concentration

- Mass Percent
- Grams of solute per total grams of solution.

$$
(\mathrm{m} / \mathrm{m}) \%=\frac{\mathrm{g} \text { Solute }}{\text { Total grams }}
$$

## Solution Concentration

- Parts Per Million
- Individual solute components per 1 million solvent components. (Usually mg solute per L solvent or ppm).
$\mathrm{ppm}=\mathrm{mg} / \mathrm{L}=\frac{\mathrm{mg} \text { Solute }}{\mathrm{L} \text { Solvent }}$

## Application Quiz

- Calculate the molarity of a solution made by dissolving 25.0 g of NaCl into 625 mL water.
0.684 M NaCl

## Dilutions

## - Dilution

- Taking a concentrated solution to a less concentration solution by increasing the amount of solvent.
$-M_{1} V_{1}=M_{2} V_{2}$

## Diluted

## Dilutions

- How much of a 2.0 M NaOH solution is needed to make 50 mL of 0.1 M NaOH ?
2.5 mL NaOH

## Dilutions

- A student needs to make 250 mL of a 0.1 M HCl solution. How much of a 4.10 M HCl solution is needed to make the required solution?

6 mL HCl

## Solution Stoichiometry

## Solution Stoichiometry

- Use Molarity to go between $L$ and mol.
- Perform stoichiometric calculations using the same steps (make a plan, determine your conversion factors, cancel units, use correct sig figs).

## Solution Stoichiometry

- 22.15 mL of a 0.109 M NaOH solution was used to completely react with 10.0 mL of a sulfuric acid solution of unknown concentration. What is the molarity of the acid solution? How many grams are dissolved in the solution?

$$
\begin{equation*}
\mathrm{H}_{2} \mathrm{SO}_{4(\mathrm{aq})}+2 \mathrm{NaOH}_{(\mathrm{aq})} \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O} \tag{I}
\end{equation*}
$$

## $0.121 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$ $0.119 \mathrm{~g} \mathrm{H}_{3} \mathrm{SO}_{4}$

## Reactions in Aqueous Solutions

- We discussed reaction classification above.
- We can further categorize many of these reactions when they occur in water.
- For example: Double Displacement reactions can be further categorized as one of several types (acidbase, precipitation etc).
- Four most common types of reactions in aqueous solutions:
- Oxidation- Reduction (Redox)
- Precipitation
- Acid-Base
- Gas Evolving

## Oxidation - Reduction Reactions

- Redox reactions occur when there is a change in the oxidation state of involved elements occurs.
- Redox reactions are often synthesis and single replacement reactions.

## Oxidation - Reduction Reactions

- Oxidation
- Loss of electrons
- Increase in oxidation number
- Increase in bonding to oxygen
- Reduction
- Gaining electrons
- Decrease in oxidation number
- Reducing the number of bonds to oxygen
- OIL RIG
- LEO GER

## Oxidation - Reduction Reactions

- Oxidizing Agent
- Substance (reactant) that is being reduced in the chemical equation.
- Causing another reactant to be oxidized.
- Reducing Agent
- Substance (reactant) being oxidized in the chemical equation.
- Causing another reactant to be reduced.

## Oxidation Numbers

- The oxidation number of any element in its native state is 0 .
- The oxidation number of oxygen in a compound is usually -2 (except for peroxides in which case oxygen's oxidation number is -1 ).
- The oxidation number of hydrogen is usually +1 (except in metal hydrides in which case hydrogen has an oxidation number of -1).
- The oxidation number of most elements in compounds is the same as the charge of the ion they would form (exceptions include group 4, and 8 -such as C and Xe ). Exceptions also include row 3 and down and column 5 and to the right... ie P, S, etc-these exceptions have oxidation numbers that can be several different things and must be solved for).
- The sum of the oxidation numbers for all atoms in a compound MUST add up to be 0 .
- The sum of the oxidation numbers for all atoms in an ion MUST add up to be equal to the charge.

## Application Quiz

- Are the following reactions redox reactions? If so, determine the substance being oxidized, the substance being reduced, the oxidizing agent and the reducing agent.

$$
\begin{equation*}
2 \mathrm{Na}_{(\mathrm{s})}+2 \mathrm{Cl}_{2(\mathrm{~g})} \rightarrow 2 \mathrm{NaCl} \tag{s}
\end{equation*}
$$

$$
2 \mathrm{KClO}_{3} \rightarrow 2 \mathrm{KCl}+3 \mathrm{O}_{2}
$$

## Application Quiz

- Are the following reaction a redox reaction? If so, determine the substance being oxidized, the substance being reduced, the oxidizing agent and the reducing agent.

$$
\mathrm{Cu}_{(\mathrm{s})}+2 \mathrm{AgNO}_{3(\mathrm{aq})} \rightarrow \mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2(\mathrm{aq})}+2 \mathrm{Ag}_{(\mathrm{s})}
$$

## Application Quiz

- Are the following reactions redox reactions? If so, determine the substance being oxidized, the substance being reduced, the oxidizing agent and the reducing agent.

$$
\mathrm{Mg}_{(\mathrm{s})}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \rightarrow \mathrm{Mg}(\mathrm{OH})_{2(\mathrm{aq})}+\mathrm{H}_{2(\mathrm{~g})}
$$

$$
\mathrm{AgNO}_{3(\mathrm{aq)}}+\mathrm{NaCl}_{(\mathrm{aq)}} \rightarrow \mathrm{AgCl}_{(\mathrm{s})}+\mathrm{NaNO}_{3(\mathrm{aq})}
$$

## Balancing Redox Reactions

- Write the oxidation and reduction half-reactions.
- Balance both reactions for all elements except oxygen and hydrogen.
- If the oxygen atoms are not balanced in either reaction, add water molecules to the side missing the oxygen.
- If the hydrogen atoms are not balanced, add hydrogen ions $\left(\mathrm{H}^{+}\right)$until the hydrogen atoms are balanced.
- Multiply the half-reactions by the appropriate numbers so that they both have equal numbers of electrons.
- Add the two equations to cancel out the electrons to balance the equation.

## Application Quiz

- Balance the following redox reaction using the half-reaction method (acidic solution).

$$
\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+\mathrm{NO}_{2}^{-} \rightarrow \mathrm{Cr}^{3+}+\mathrm{NO}_{3}^{-}
$$

## Application Quiz

- Balance the following redox reaction using the half-reaction method (acidic solution).

$$
\mathrm{HCOOH}+\mathrm{MnO}_{4}^{-} \mathrm{CO}_{2}+\mathrm{Mn}^{2+}
$$

## Precipitation Reactions

- These double displacement reactions occur when on of the products forms an insoluble solute.

$$
\begin{equation*}
\mathrm{AB}_{(\mathrm{aq})}+\mathrm{CD}_{(\mathrm{aq})} \rightarrow \mathrm{AD}_{(\mathrm{aq})}+\mathrm{CB} \tag{s}
\end{equation*}
$$

$2 \mathrm{AgNO}_{3(\mathrm{aq})}+\mathrm{MgCl}_{2(\mathrm{aq})} \rightarrow \mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2(\mathrm{aq})}+2 \mathrm{AgCl}$

## Solubility Rules

- Nitrates, group 1 metals, ammonium and acetate containing compounds are ALWAYS soluble. There are no exceptions.
- Chloride, bromide and iodides are soluble UNLESS paired with silver, mercury or lead in which case they become insoluble.
- Sulfates are soluble unless paired with barium, calcium, mercury or lead, in which case they become insoluble.
- Hydroxides are not soluble UNLESS paired with barium, calcium, or any ion that is always soluble. In these cases hydroxide become soluble.
- Sulfates, carbonates, chromates and phosphates are not soluble UNLESS paired with something that is always soluble in which case they become soluble.

## Soluble <br> $\mathrm{NO}_{3}{ }^{-}$ <br> Group 1 Metals, $\mathrm{NH}_{4}{ }^{+}, \mathrm{CH}_{3} \mathrm{COO}^{-}$

Not Soluble
$\mathrm{Cl}^{-}, \mathrm{Br}, \mathrm{l} \mathrm{l}^{-} \longrightarrow \mathrm{Ag}, \mathrm{Hg}, \mathrm{Pb}$
$\mathrm{SO}_{4}{ }^{2+} \longrightarrow \mathrm{Ba}, \mathrm{Ca}, \mathrm{Hg}, \mathrm{Pb}$
Ba, Ca, Group 1 Metals, $\mathrm{NH}_{4}{ }^{+} \longleftarrow \mathrm{OH}^{-}$
Group 1 Metals, $\mathrm{NH}_{4}{ }^{+} \longleftarrow \mathrm{S}^{2-}, \mathrm{CO}_{3}{ }^{2-}, \mathrm{CrO}_{4}{ }^{2-}, \mathrm{PO}_{4}{ }^{3-}$

## Predicting Precipitates

- Use solubility rules to determine the precipitate

$$
\mathrm{Ba}(\mathrm{OH})_{2}+\mathrm{K}_{2} \mathrm{SO}_{4} \rightarrow \mathrm{BaSO}_{4}+2 \mathrm{KOH}
$$

$3 \mathrm{Fe}\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2}+2 \mathrm{H}_{3} \mathrm{PO}_{4} \rightarrow \mathrm{Fe}_{3}\left(\mathrm{PO}_{4}\right)_{2}+6 \mathrm{CH}_{3} \mathrm{COOH}$
$2 \mathrm{KNO}_{3}+\mathrm{HgCl}_{2} \rightarrow 2 \mathrm{KCl}+\mathrm{Hg}\left(\mathrm{NO}_{3}\right)_{2}$

## Net lonic Equations

- Chemical Equations
- Tell what reacted and what was produced.
- Compete Ionic Equations
- Give every species in its form in solution.
- Net lonic Equations
- Show only what reacts/changes in the chemical equation.

## Net lonic Equations

- Give the net ionic equation for:
$\mathrm{Ba}(\mathrm{OH})_{2}+\mathrm{K}_{2} \mathrm{SO}_{4} \rightarrow \mathrm{BaSO}_{4}+2 \mathrm{KOH}$

## Predicting Precipitates

- Give the net ionic equation for:
$3 \mathrm{Fe}\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2}+2 \mathrm{H}_{3} \mathrm{PO}_{4} \rightarrow \mathrm{Fe}_{3}\left(\mathrm{PO}_{4}\right)_{2}+6 \mathrm{CH}_{3} \mathrm{COOH}$

## Predicting Precipitates

- Give the net ionic equation for:
$2 \mathrm{KNO}_{3}+\mathrm{HgCl}_{2} \rightarrow 2 \mathrm{KCl}+\mathrm{Hg}\left(\mathrm{NO}_{3}\right)_{2}$

## Acid-Base Reactions

- Neutralization reactions - an acid reacts with a base to produce a salt and water.

## Acid - Base Properties

- Acid
- In Unit 2 defined as a substance that produces $\mathrm{H}^{+}$in solution.
- Bronsted-Lowry expands definition to any species that donates a proton.
- Dissociates to lower pH of solution
- Base
- In Unit 2 produces $\mathrm{OH}^{-}$in solution
- Bronsted-Lowry expands definition to any species that accepts a proton.
- ie: $\mathrm{NH}_{3}$ can also accept a proton $=$ is a base
- Dissociates in water to increase pH of solution

## pH Scale

- A measure of the acidity of a solution
- Logarithmic representation
- $\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]$
- $\mathrm{pH}<7=$ acidic
- $\mathrm{pH}>7$ = basic (alkaline)

## Acid - Base Strength

- Strong Acids
- Completely dissociate
- Are strong electrolytes
$-\mathrm{HCl}, \mathrm{HBr}, \mathrm{HI}, \mathrm{HClO}_{3}, \mathrm{HNO}_{3}$ and $\mathrm{H}_{2} \mathrm{SO}_{4}$
- Strong Bases
- Completely dissociate
- Are strong electrolytes
- Group 1 metals paired with $\mathrm{OH}^{-}$

## Acid - Base Reactions

- Weak Acid and Weak Base:
$2 \mathrm{CH}_{3} \mathrm{COOH}_{(\mathrm{aq})}+\mathrm{Ca}(\mathrm{OH})_{2(\text { aq })} \rightarrow \mathrm{Ca}\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2(\mathrm{aq})}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}$
- Strong Acid and Weak Base:
$\mathrm{HCl}_{(\mathrm{aq})}+\mathrm{NH}_{3 \text { (aq) }} \rightarrow \mathrm{NH}_{4}^{+}{ }_{(\mathrm{aq})}+\mathrm{Cl}^{-}{ }_{(\mathrm{aq})}$
$\left.\mathrm{NH}_{4}{ }^{+}{ }_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}\right) \rightarrow \mathrm{NH}_{3}{ }^{+}{ }_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}$

## Acid - Base Reactions

- Strong Acid and Strong Base: $\mathrm{HCl}_{(\mathrm{aq})}+\mathrm{NaOH}_{(\mathrm{aq})} \rightarrow \mathrm{NaCl}_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}$
- Net ionic equation for strong acid reacting with strong base is always:

$$
\begin{equation*}
\mathrm{H}^{+}{ }_{(\mathrm{aq})}+\mathrm{OH}^{-}{ }_{(\mathrm{aq})} \rightarrow \mathrm{H}_{2} \mathrm{O} \tag{I}
\end{equation*}
$$

## Acid-Base Reactions

- Titrations
- Used to calculate the mol of an unknown (usually acidic) solution (analyte) containing an indicator by delivering a measured volume of a (usually basic) solution with a known concentration of (also called the titrant).
- Equivalence Point is when mol acid = mol base
- End Point is when you see a color change, usually slightly more base than acid present.

## Titration Calculations

- How much of a 0.500 M solution of NaOH is needed to react with 0.88 L of 1.2 M HCl ?
2.1 L NaOH

## Titration Calculations

- How much of a 0.175 M solution of sodium hydroxide is needed to completely react with 0.062 L of 0.25 M phosphoric acid?
0.27 L NaOH or 270 mL

## Gas Evolving Reactions

- Will always produce a gas as a product.
- Usually be combustion, single replacement, or decomposition reactions.
- Are also usually redox reactions.

$$
\begin{gathered}
\mathrm{Mg}_{(\mathrm{s})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \rightarrow \mathrm{Mg}(\mathrm{OH})_{2(\mathrm{aq})}+\mathrm{H}_{2(\mathrm{~g})} \\
2 \mathrm{KClO}_{3} \rightarrow 2 \mathrm{KCl}+3 \mathrm{O}_{2}
\end{gathered}
$$

## Summary

- There are 5 signs a chemical reaction has taken place.
- Each reaction can be classified as 1 of 5 main types.
- Solution concentration can be calculated and used in stoichiometric problems.
- Electrolytes (or soluble ionic compounds) cause a solution to conduct electricity.
- Aqueous reactions can be classified further than into the 5 main categories.
- Redox reactions have a change in oxidation number.
- Precipitation reactions produce an insoluble precipitate.
- Neutralization reactions involve acids and bases.
- Gas evolving reactions produce a gas.
